

## **Cost Benefit Analysis: a methodology for the evaluation of the economic performance of IPM**

#### Marianne Lefebvre

DUFE

European Commission, DG Joint Research Center, IPTS, Seville (ES) Montpellier Supagro, UMR LAMETA (FR)

IPM innovation in Europe, Poznan, 14-16 January 2015

## Background

Incentives and policies for integrated pest management in Europe: a review, M. Lefebvre, S. R. H. Langrell, S. Gomez-y-Paloma, Agronomy for Sustainaible Development (2015) 35 (1): 27-45

pure

### Cost Benefit Analysis as implemented in the PURE project

DUTE

PURE - Deliverable D1.5 Funded by the European Union PURE Pesticide Use-and-risk Reduction in European farming systems with Integrated Pest Management Grant agreement number: FP7-265865 **Collaborative Project** SEVENTH FRAMEWORK PROGRAMME D1.5 **Cost-benefit analysis of IPM solutions** Due date of deliverable: M 48 Actual submission date: M 48 Start date of the project: March 1<sup>st</sup>, 2011 Duration: 48 months Workpackage concerned: WP 1 Concerned workpackage leader: Jean-Noël Aubertot Organisation name of lead contractor: JRC-IPTS European Commission, Joint Research Centre (JRC), Institute for Prospective Technological Studies (IPTS), Agrilife Unit, Edificio Expo. c/ Inca Garcilaso, 3, 41092 Seville, Spain Authors: Marianne Lefebvre • Stephen Langrell • Sergio Gomez-y-Paloma Project co-funded by the European Commission within the Seventh Framework Programme (2007 -2013)**Dissemination Level** PU Public PU PP Restricted to other programme participants (including the Commission Services) RE Restricted to a group specified by the consortium (including the Commission Services) CO Confidential, only for members of the consortium (including the Commission Services)

## Indicators of economic performance SEVENTH FRAMEWOR

## Partial vs Complete CBA

DUTE

	Description	WP
		concerned
Complete CBA	Information on costs is collected for all operations. This approach is relevant when the tested IPM solution corresponds to an important change in the system, i.e. impacting various operations.	WP2, WP3
Partial CBA	When the tested IPM solution corresponds only to a marginal change (impacting only 1 or 2 operations for example), data are collected ONLY for these operations impacted by IPM. The economic analysis limits to the comparison of the extra costs or costs saving associated to the IPM solution. Operations that are the same in both the reference system and the IPM system (e.g. fertilization) are left out of consideration.	WP4, WP5, WP6, WP7

## Analysis of perenial crops vs arable crops rotations

Adapt the methodology to include all crops (not only the more profitable one)

DUre

#### Are all crops grown each year?

Annualized gross margin is estimated by averaging net gross margin across the years corresponding to the rotation length (one complete repetition of a crop sequence), and across each of the individual crop of a particular crop rotation.

### Machinery costs

Investment costs (Euros)

#### Annual costs (Euros/ha)

S

Ū

S

- Depreciation
- Interest
- Maintenance
- Insurance

S 

#### **Machinery costs**

Investment costs (Euros)

Annual costs (Euros/ha)

- Depreciation
- Interest
- Maintenance
- Insurance

Let's take a pragmatic approach !

#### **Contractor cost** by operation

- labour
- machinery
- fuel

#### Table 4: Contractor costs (including costs of machine, labour and fuel) for winter-wheat based rotations

DE (€/ha)	MA: maize	WB: winter barley	WW: winter wheat
Ploughing and pressing	135	132	97
Seed bed preparation	45	45	31
Sowing	64	43	37
Spraying	15	15	12
N fertilisation	10	9	8
Mechanical weeding			13
Combining	450	186	155

• Farm gate price received for IPM products

When the harvested crop are sold to different market segments (local, exports, cooperatives...), the price is calculated as the weighted average of prices in the different markets, where the weight corresponds to the share of each market in total sales.

• Impact of IPM on crop quality

Ex of criteria to classify the products: fruit category, residue level, sugar and acidity level (grapes), animal versus human feed (maize)

# 2. Some thoughts about how to improve economic evaluation in future IPM research projects

DULTE

DUTE

"I had my accounting department run a cost-benefit analysis on you and I have some bad news."

- Integrate economic evaluation to agronomic and environmental evaluation (as in Dexipm...)
- Invest time in careful data collection rather than complex data analysis

## **Cost-Benefit-Risk analysis**

A risk assessment consists of studying the probability that the IPM farming practices will achieve different performance level

- Trade-off Expected profits Variability of profits for risk-averse farmers (Lu, Watkins et al. 1999; Griffiths, Holland et al. 2008)
- Sensitivity analysis: If the IPM system is more profitable than the reference system only for very specific output prices, then it suggests the solution is rather risky.
- Which risk indicator to capture farmers' perception of and aversion to risk ?

DUTE

PROGRAMME

## Scaling-up economic analysis From private to social CBA

DUTE

#### **Private Cost Benefit Analysis:**

Monetary evaluation of profit for the producer

#### **Social Cost Benefit Analysis:**

Monetary evaluation of

producer + consumer + taxpayer welfare including social, economic, environmental sustainability aspects

## Scaling-up economic analysis From field scale to value chain

Farm strategy; Portfolio activities

of

pure

Short-term vs long-term profitability at farm level Retail sector organization

- regarding
- IPM products
- special crops

How to certify the compliance with such complex guidelines?

How to communicate to end-consumer?

What is consumers' understanding and willingness to pay for IPM ?

# Thank you for your attention
