Project description: The subject of the project will be the creation of a national IT system for plant protection, which significantly affects the quality and quantity of food produced in Poland. The tool will work for farmers – food producers, support for gardeners, fruit growers and consumers of food. Data provided under the system will also be used by public institutions, including LGUs and scientific units, to carry out their own tasks in the field of plant protection. The system will be used to provide e-services by the Regional Agricultural Advisory Centers (ODR).
